- Discuss the fundamental transformations of CGA.

Blades

Let $\mathbb{V}^n$ denote an *n*-dimensional vector space.

Let $\mathbb{V}^n$ denote an n-dimensional vector space.

Let $\{b_k\}_{k=1}^m$ be a set of m vectors taken from $\mathbb{V}^n$.

Blades

Let $\mathbb{V}^n$ denote an *n*-dimensional vector space.
Let $\{b_k\}_{k=1}^m$ be a set of m vectors taken from $\mathbb{V}^n$.

Definition

We say the blade B, given by

$$B = \bigwedge_{k=1}^m b_k = b_1 \wedge \cdots \wedge b_m,$$

is a non-zero *m*-blade if and only if $\{b_k\}_{k=1}^m$ is a linearly
independent set of vectors.

Blades

Let $\mathbb{V}^n$ denote an *n*-dimensional vector space.
Let $\{b_k\}_{k=1}^m$ be a set of *m* vectors taken from $\mathbb{V}^n$.

Definition

We say the blade B, given by

$$B = \bigwedge_{k=1}^m b_k = b_1 \wedge \cdots \wedge b_m,$$

is a non-zero *m*-blade if and only if $\{b_k\}_{k=1}^m$ is a linearly independent set of vectors.

Clearly, if $B \neq 0$, then we must have $\text{grade}(B) = m \leq n$.

Imagine an infinite m-dimensional hyper-plane.

Imagine an infinite m-dimensional hyper-plane.
Think of B as a finite m-dimensional hyper-plane.

Imagine an infinite m-dimensional hyper-plane.
Think of B as a finite m-dimensional hyper-plane.
Attitude matters, position does not.

Visualizing Euclidean Blades

Imagine an infinite m-dimensional hyper-plane.

Think of B as a finite m-dimensional hyper-plane.

Attitude matters, position does not.

Non-Euclidean blades require more imagination!

Imagine an infinite m-dimensional hyper-plane.

Think of B as a finite m-dimensional hyper-plane.

Attitude matters, position does not.

Non-Euclidean blades require more imagination!

Our geometric arguments will not require us to visualize the homogeneous representation space.

Recall that $B = b_1 \wedge \cdots \wedge b_m$.

Recall that $B = b_1 \wedge \cdots \wedge b_m$.

Definition

For any $v \in \mathbb{V}^n$, we say that

$$v \in B \text{ if and only if } v \in \text{span}\{b_k\}_{k=1}^m.$$

Recall that $B = b_1 \wedge \cdots \wedge b_m$.

Definition

For any $v \in \mathbb{V}^n$, we say that

$$v \in B \text{ if and only if } v \in \text{span}\{b_k\}_{k=1}^m.$$

Definition

If $v \notin B$, then $v \in B^*$, which represents the complement $(\mathbb{V}^n - \text{span}\{b_k\}_{k=1}^m) \cup \{0\}$.

Let $v_\parallel$ denote the orthogonal projection of v down onto B.

Let $v_\parallel$ denote the orthogonal projection of v down onto B.

Let $v_\perp = v - v_\parallel$ denote the orthogonal rejection of v from B.

Building Intuition About Euclidean Blades

Let $v_\parallel$ denote the orthogonal projection of v down onto B.
Let $v_\perp = v - v_\parallel$ denote the orthogonal rejection of v from B.
For any vector $v \in \mathbb{V}^n$, we have

$$v \wedge B = (v_\parallel + v_\perp) \wedge B = v_\perp \wedge B,$$
$$v \cdot B = (v_\parallel + v_\perp) \cdot B = v_\parallel \cdot B.$$

Let $v_\parallel$ denote the orthogonal projection of v down onto B.
Let $v_\perp = v - v_\parallel$ denote the orthogonal rejection of v from B.
For any vector $v \in \mathbb{V}^n$, we have

$$v \wedge B = (v_\parallel + v_\perp) \wedge B = v_\perp \wedge B,$$
$$v \cdot B = (v_\parallel + v_\perp) \cdot B = v_\parallel \cdot B.$$

$$\mathrm{grade}(v \wedge B) = \mathrm{grade}(B) + 1$$
$$\mathrm{grade}(v \cdot B) = \mathrm{grade}(B) - 1$$

Let $v_\parallel$ denote the orthogonal projection of v down onto B.
Let $v_\perp = v - v_\parallel$ denote the orthogonal rejection of v from B.
For any vector $v \in \mathbb{V}^n$, we have

$$v \wedge B = (v_\parallel + v_\perp) \wedge B = v_\perp \wedge B,$$
$$v \cdot B = (v_\parallel + v_\perp) \cdot B = v_\parallel \cdot B.$$

$$\mathrm{grade}(v \wedge B) = \mathrm{grade}(B) + 1$$
$$\mathrm{grade}(v \cdot B) = \mathrm{grade}(B) - 1$$

We may also imagine $v \cdot B = (v \wedge B^*)^*$, where B^* is the complement of B with respect to $\mathbb{V}^n$.

If $B \neq 0$, then $v \in B$ if and only if $v \wedge B = 0$.

If $B \neq 0$, then $v \in B$ if and only if $v \wedge B = 0$.

Proof.

The set $\{b_k\}_{k=1}^m$ is linearly independent while the set $\{v\} \cup \{b_k\}_{k=1}^m$ is linearly dependent. $\qquad\square$

If $B \neq 0$, then $v \in B$ if and only if $v \wedge B = 0$.

Proof.

The set $\{b_k\}_{k=1}^m$ is linearly independent while the set $\{v\} \cup \{b_k\}_{k=1}^m$ is linearly dependent. $\qquad \square$

If $B \neq 0$, then $v \in B^*$ if and only if $v \cdot B = 0$.

If $B \neq 0$, then $v \in B$ if and only if $v \wedge B = 0$.

Proof.

The set $\{b_k\}_{k=1}^{m}$ is linearly independent while the set $\{v\} \cup \{b_k\}_{k=1}^{m}$ is linearly dependent. □

If $B \neq 0$, then $v \in B^*$ if and only if $v \cdot B = 0$.

Proof.

Notice that $0 = v \cdot B = (v \wedge B^*)^*$ if and only if $v \wedge B^* = 0$. □

Blades May Represent Geometries

Let $\mathbb{R}^n$ denote *n*-dimensional Euclidean space.

Blades May Represent Geometries

Let $\mathbb{R}^n$ denote n-dimensional Euclidean space.

Let $p : \mathbb{R}^n \to \mathbb{G}(\mathbb{V}^n)$ be a vector-valued function of a Euclidean point.

Blades May Represent Geometries

Let $\mathbb{R}^n$ denote n-dimensional Euclidean space.
Let $p : \mathbb{R}^n \to \mathbb{G}(\mathbb{V}^n)$ be a vector-valued function of a Euclidean point.

Definition

We say that B directly represents a geometry as the set of all points

$$G(B) = \{x \in \mathbb{R}^n | p(x) \in B\}.$$

Let $\mathbb{R}^n$ denote n-dimensional Euclidean space.
Let $p : \mathbb{R}^n \to \mathbb{G}(\mathbb{V}^n)$ be a vector-valued function of a Euclidean point.

Definition

We say that B directly represents a geometry as the set of all points

$$G(B) = \{x \in \mathbb{R}^n | p(x) \in B\}.$$

Definition

We say that B dually represents a geometry as the set of all points

$$G^*(B) = \{x \in \mathbb{R}^n | p(x) \in B^*\}.$$

Blades May Represent Geometries

Let $\mathbb{R}^n$ denote n-dimensional Euclidean space.
Let $p : \mathbb{R}^n \to \mathbb{G}(\mathbb{V}^n)$ be a vector-valued function of a Euclidean point.

Definition

We say that B directly represents a geometry as the set of all points

$$G(B) = \{x \in \mathbb{R}^n | p(x) \in B\}.$$

Definition

We say that B dually represents a geometry as the set of all points

$$G^*(B) = \{x \in \mathbb{R}^n | p(x) \in B^*\}.$$

Note that $G(B) = G^*(B^*)$ and $G^*(B) = G(B^*)$.

For any two blades $A, B \in \mathbb{G}(\mathbb{V}^n)$ such that $A \wedge B \neq 0$, we have

$$G(A) \cup G(B) \subseteq G(A \wedge B).$$

We Can Combine Geometries

For any two blades $A, B \in \mathbb{G}(\mathbb{V}^n)$ such that $A \wedge B \neq 0$, we have

$$G(A) \cup G(B) \subseteq G(A \wedge B).$$

Proof.

$$p(x) \in A \text{ or } p(x) \in B$$
$$\implies p(x) \in A \wedge B$$

$\square$

We Can Combine Geometries

For any two blades $A, B \in \mathbb{G}(\mathbb{V}^n)$ such that $A \wedge B \neq 0$, we have

$$G(A) \cup G(B) \subseteq G(A \wedge B).$$

Proof.

$$p(x) \in A \text{ or } p(x) \in B$$
$$\implies p(x) \in A \wedge B$$

$\square$

Let $C \subseteq A \wedge B$ represent the smallest vector sub-space such that $p(x) \in C$. Then we might have $C \not\subseteq A$ and $C \not\subseteq B$.

For any two blades $A, B \in \mathbb{G}(\mathbb{V}^n)$ such that $A \wedge B \neq 0$, we have

$$G^*(A) \cap G^*(B) = G^*(A \wedge B).$$

We Can Intersect Geometries

For any two blades $A, B \in \mathbb{G}(\mathbb{V}^n)$ such that $A \wedge B \neq 0$, we have

$$G^*(A) \cap G^*(B) = G^*(A \wedge B).$$

Proof.

$$p(x) \in A^* \text{ and } p(x) \in B^*$$
$$\text{iff } p(x) \notin A \text{ and } p(x) \notin B$$
$$\text{iff } p(x) \notin A \wedge B$$
$$\text{iff } p(x) \in (A \wedge B)^*$$

$\square$

For any non-zero scalar λ, we have $G(B) = G(\lambda B)$.

For any non-zero scalar λ, we have $G(B) = G(\lambda B)$.
For any blade B, there is a scalar λ such that λB is a homogenized form.

For any non-zero scalar λ, we have $G(B) = G(\lambda B)$.

For any blade B, there is a scalar λ such that λB is a homogenized form.

If B is the result of some geometric operation, then such a λ has geometric signficance WRT to that operation.

The Geometric Product

Definition

For any vector $v \in \mathbb{V}^n$ and any blade $B \in \mathbb{G}(\mathbb{V}^n)$, we define

$$vB = v \cdot B + v \wedge B.$$

Let $\{v_k\}_{k=1}^m$ be any set of m vectors.

Versors

Let $\{v_k\}_{k=1}^m$ be any set of m vectors.

Definition

We say the element $V \in \mathbb{G}(\mathbb{V}^n)$, given by

$$V = \prod_{k=1}^m v_k,$$

is a versor if and only if for all k, the vector v_k^{-1} exists.

Versors

Let $\{v_k\}_{k=1}^m$ be any set of m vectors.

Definition

We say the element $V \in \mathbb{G}(\mathbb{V}^n)$, given by

$$V = \prod_{k=1}^m v_k,$$

is a versor if and only if for all k, the vector v_k^{-1} exists.

Notice that $v^{-1} = v/v^2$.

Definition

Given the versor $V = v_1 \ldots v_m$, we define

$$\tilde{V} = \prod_{k=1}^{m} v_{m-k+1}.$$

The Inverse And The Reverse Of Versors

Definition

Given the versor $V = v_1 \ldots v_m$, we define

$$\tilde{V} = \prod_{k=1}^{m} v_{m-k+1}.$$

The inverse V^{-1} of V is therefore given by

$$V^{-1} = \frac{\tilde{V}}{V\tilde{V}}.$$

Versors form a group under the geometric product.

The Versor Group

Versors form a group under the geometric product.

Proof.

Associativity follows from the associativity of the geometric product.

The scalar 1 is the identity versor.

For every versor V, there exists an inverse V^{-1} such that $VV^{-1} = V^{-1}V = 1$. ☐

Conjugation by versors is outermorphic!

Properties Of Versors

Conjugation by versors is outermorphic!

Recall that $B = b_1 \wedge \cdots \wedge b_m$. We then have

$$VBV^{-1} = \bigwedge_{k=1}^{m} Vb_k V^{-1}.$$

Conjugation by versors is outermorphic!

Recall that $B = b_1 \wedge \cdots \wedge b_m$. We then have

$$VBV^{-1} = \bigwedge_{k=1}^{m} Vb_k V^{-1}.$$

Conjugation by versors is grade preserving!

Conjugation by versors is outermorphic!
Recall that $B = b_1 \wedge \cdots \wedge b_m$. We then have

$$VBV^{-1} = \bigwedge_{k=1}^{m} Vb_k V^{-1}.$$

Conjugation by versors is grade preserving!
For any vector $v \in \mathbb{V}^n$, we have $VvV^{-1} \in \mathbb{V}^n$, therefore, we have $\mathrm{grade}(B) = \mathrm{grade}(VBV^{-1})$.

It follows that versors may be used to represent transformations of geometry as versors conjugated with blades representative of geometry.

It follows that versors may be used to represent transformations of geometry as versors conjugated with blades representative of geometry.

Given $G(B)$, it will be interesting to investigate $G(VBV^{-1})$.

Replace $\mathbb{R}^n$ with $\mathbb{V}^n$.

Replace $\mathbb{R}^n$ with $\mathbb{V}^n$.

Embed $\mathbb{V}^n$ in $\mathbb{V}^{n+2}$ as a Euclidean vector sub-space of a non-Euclidean vector space.

Replace $\mathbb{R}^n$ with $\mathbb{V}^n$.

Embed $\mathbb{V}^n$ in $\mathbb{V}^{n+2}$ as a Euclidean vector sub-space of a non-Euclidean vector space.

Let $o, \infty \in \mathbb{V}^{n+2}$ be vectors such that $o \cdot o = \infty \cdot \infty = 0$ and $o \cdot \infty = \infty \cdot o = -1$ and for all $v \in \mathbb{V}^n$, we have $v \cdot o = v \cdot \infty = 0$.

The Specifics Of The Conformal Model

Replace $\mathbb{R}^n$ with $\mathbb{V}^n$.

Embed $\mathbb{V}^n$ in $\mathbb{V}^{n+2}$ as a Euclidean vector sub-space of a non-Euclidean vector space.

Let $o, \infty \in \mathbb{V}^{n+2}$ be vectors such that $o \cdot o = \infty \cdot \infty = 0$ and $o \cdot \infty = \infty \cdot o = -1$ and for all $v \in \mathbb{V}^n$, we have $v \cdot o = v \cdot \infty = 0$.

Definition

Define $p : \mathbb{V}^n \to \mathbb{G}(\mathbb{V}^{n+2})$ as

$$p(x) = o + x + \frac{1}{2}x^2 \infty.$$

Replace $\mathbb{R}^n$ with $\mathbb{V}^n$.

Embed $\mathbb{V}^n$ in $\mathbb{V}^{n+2}$ as a Euclidean vector sub-space of a non-Euclidean vector space.

Let $o, \infty \in \mathbb{V}^{n+2}$ be vectors such that $o \cdot o = \infty \cdot \infty = 0$ and $o \cdot \infty = \infty \cdot o = -1$ and for all $v \in \mathbb{V}^n$, we have $v \cdot o = v \cdot \infty = 0$.

Definition

Define $p : \mathbb{V}^n \to \mathbb{G}(\mathbb{V}^{n+2})$ as

$$p(x) = o + x + \frac{1}{2}x^2\infty.$$

Having invented this specific model, what we are now able to discover about it is almost endless!

For any $c \in \mathbb{V}^n$, the vector $p(c)$ both dually and directly represents the point c in space.

For any $c \in \mathbb{V}^n$, the vector $p(c)$ both dually and directly represents the point c in space.

That is, $G(p(c)) = G^*(p(c)) = \{c\}$.

The function $p(x)$ factors out of the equation

$$(x - c)^2 - r^2 = 0$$

as the alternative equation

$$p(x) \cdot \left(p(c) - \frac{1}{2} r^2 \infty \right) = 0.$$

The function $p(x)$ factors out of the equation

$$(x - c)^2 - r^2 = 0$$

as the alternative equation

$$p(x) \cdot \left(p(c) - \frac{1}{2} r^2 \infty \right) = 0.$$

Points are degenerate spheres, or spheres with radius zero.

The function $p(x)$ factors out of the equation

$$(x - c)^2 - r^2 = 0$$

as the alternative equation

$$p(x) \cdot \left(p(c) - \frac{1}{2} r^2 \infty \right) = 0.$$

Points are degenerate spheres, or spheres with radius zero. We may refer to $p(c)$ as a round point.

Let $\{\sigma_k\}_{k=1}^m$ be m spheres of dimension n having a non-empty and non-degenerate intersection.

Let $\{\sigma_k\}_{k=1}^m$ be m spheres of dimension n having a non-empty and non-degenerate intersection.

Then the blade B, given by

$$B = \bigwedge_{k=1}^m \sigma_k,$$

dually represents an $(n - m + 1)$-dimensional hyper-sphere.

Let $\{\sigma_k\}_{k=1}^m$ be m spheres of dimension n having a non-empty and non-degenerate intersection.

Then the blade B, given by

$$B = \bigwedge_{k=1}^m \sigma_k,$$

dually represents an $(n - m + 1)$-dimensional hyper-sphere.

Rounds with zero radius give us tangent points!
Figure : 3 Rounds, 3 Circles and 1 Point-Pair

The function $p(x)$ factors out of the equation

$$(x - c) \cdot v = 0$$

as the alternative equation

$$p(x) \cdot (v + (c \cdot v)\infty) = 0.$$

Let $\{\pi_k\}_{k=1}^m$ be m planes of dimension $n-1$ having a non-empty and non-degenerate intersection.

Let $\{\pi_k\}_{k=1}^m$ be m planes of dimension $n-1$ having a non-empty and non-degenerate intersection.

Then the blade B, given by

$$B = \bigwedge_{k=1}^m \pi_k,$$

dually represents an $(n-m)$-dimensional hyper-plane.

Let $\{\pi_k\}_{k=1}^m$ be m planes of dimension $n-1$ having a non-empty and non-degenerate intersection.

Then the blade B, given by

$$B = \bigwedge_{k=1}^m \pi_k,$$

dually represents an $(n-m)$-dimensional hyper-plane.

Flats at infinity are free blades.

Let $\{\pi_k\}_{k=1}^m$ be m planes of dimension $n-1$ having a non-empty and non-degenerate intersection.

Then the blade B, given by

$$B = \bigwedge_{k=1}^m \pi_k,$$

dually represents an $(n-m)$-dimensional hyper-plane.

Flats at infinity are free blades.

0-dimensional flats are called flat points.
Figure : 3 Planes, 3 Lines, 1 Flat-Point

Definition

For $m \geq 0$, a set of $m + 2$ points $\{x_k\}_{k=1}^{m+2} \subset \mathbb{V}^n$ are
co-m-hyper-planar if...

> For $m = 0$, the points are identical,
> For $m = 1$, the points are collinear,
> For $m = 2$, the points are coplanar,
> For $m = 3$, the points are co-hyper-planar,
> etc...

Lemma

For $m \geq 1$, if $m + 1$ points $\{x_k\}_{k=1}^{m+1} \subset \mathbb{V}^n$ are non-co-$(m-1)$-hyper-planar, then $\{p(x_k)\}_{k=1}^{m+1}$ is a linearly independent set.

Lemma

For $m \geq 1$, if $m + 1$ points $\{x_k\}_{k=1}^{m+1} \subset \mathbb{V}^n$ are non-co-$(m-1)$-hyper-planar, then $\{p(x_k)\}_{k=1}^{m+1}$ is a linearly independent set.

The proof is not hard, but too big for this slide.

Let $m \geq 1$. For $m + 1$ points $\{x_k\}_{k=1}^{m+1} \subset \mathbb{V}^n$ on an m-dimensional hyper-sphere that are non-co-$(m-1)$-hyper-planar, the blade B, given by

$$B = \bigwedge_{k=1}^{m+1} p(x_k)$$

directly represents the m-dimensional hyper-sphere.

Let $m \geq 1$. For $m + 1$ points $\{x_k\}_{k=1}^{m+1} \subset \mathbb{V}^n$ on an m-dimensional hyper-sphere that are non-co-$(m-1)$-hyper-planar, the blade B, given by

$$B = \bigwedge_{k=1}^{m+1} p(x_k)$$

directly represents the m-dimensional hyper-sphere.

Proof.

Let the $(n-m+1)$-blade A dually represent the m-dimensional hyper-sphere determined by the points. If A dually represents this sphere, then A^* directly represents this sphere. Therefore, we need to show that there exists $\lambda \in \mathbb{R}$ such that $A^* = \lambda B$. For all k, we have $p(x_k) \in A^*$ and $p(x_k) \in B$. By our lemma, $\{p(x_k)\}_{k=1}^{m}$ is a linearly independent set. Lastly, $\mathrm{grade}(B) = m + 1 = n + 2 - (n - m + 1) = n + 2 - \mathrm{grade}(A) = \mathrm{grade}(A^*)$. $\qquad \square$

A Generalization Of Cospherical

Definition

For $m \geq 1$, a set of $m+1$ points $\{x_k\}_{k=1}^{m+1} \subset \mathbb{V}^n$ are co-m-hyper-planar if...

> For $m = 1$, the points are co-point-pair (distinct),
> For $m = 2$, the points are co-circular,
> For $m = 3$, the points are co-spherical,
> For $m = 4$, the points are co-hyper-spherical,
> etc...

Let $m \geq 1$. For $m + 2$ points $\{x_k\}_{k=1}^{m+2} \subset \mathbb{V}^n$ on an m-dimensional hyper-plane that are (1) non-co-$(m-1)$-hyper-planar and (2) non-co-m-hyper-spherical, the blade B, given by

$$B = \bigwedge_{k=1}^{m+2} p(x_k),$$

directly represents the m-dimensional hyper-plane.

Let $m \geq 1$. For $m + 2$ points $\{x_k\}_{k=1}^{m+2} \subset \mathbb{V}^n$ on an m-dimensional hyper-plane that are (1) non-co-$(m-1)$-hyper-planar and (2) non-co-m-hyper-spherical, the blade B, given by

$$B = \bigwedge_{k=1}^{m+2} p(x_k),$$

directly represents the m-dimensional hyper-plane.

Proof.

By (1), there exists the $(n-m)$-blade A dually representative of the m-dimensional hyper-plane. By (2), $B \neq 0$. Lastly, $\text{grade}(B) = m + 2 = n + 2 - (n - m) = n + 2 - \text{grade}(A) = \text{grade}(A^*)$. $\square$

Let $m \geq 0$. For $m + 1$ points $\{x_k\}_{k=1}^{m+1} \subset \mathbb{V}^n$ on an m-dimensional hyepr-plane that are non-co-$(m-1)$-hyper-planar, the blade B, give by

$$B = \infty \wedge \bigwedge_{k=1}^{m+1} p(x_k),$$

directly represents the m-dimensional hyper-plane.

Let $m \geq 0$. For $m + 1$ points $\{x_k\}_{k=1}^{m+1} \subset \mathbb{V}^n$ on an m-dimensional hyepr-plane that are non-co-$(m-1)$-hyper-planar, the blade B, give by

$$B = \infty \wedge \bigwedge_{k=1}^{m+1} p(x_k),$$

directly represents the m-dimensional hyper-plane.
The proof, again, is not hard, but can't fit here.

Question: Given a dual line L and a point P not on L, how do I find the dual plane N containing L and P?

Question: Given a dual line L and a point P not on L, how do I find the dual plane N containing L and P?

Answer: $N = (P \wedge L^*)^* = P \cdot L$.

Question: Given a dual line L and a point P not on L, how do I find the dual plane N containing L and P?

Answer: $N = (P \wedge L^*)^* = P \cdot L$.

Question: Given a dual circle C and a point P not on C or on the plane determined by C, how do I find the dual sphere S containing C and P?

Answer: $N = (P \wedge L^*)^* = P \cdot L$.

Question: Given a dual circle C and a point P not on C or on the plane determined by C, how do I find the dual sphere S containing C and P?

Answer: $S = (P \wedge C^*)^* = P \cdot C$.

Question: Let S be a dual sphere that intersects a dual plane N in more than one point, and let P be a point on S but not on N. Then, if P' is the reflection of P about N, what is the dual sphere reflection S' of S about N?

Answer:

$$S' = (P' \wedge (S \wedge N)^*)^* = P' \cdot (S \wedge N) = (P' \cdot S)N - (P' \cdot N)S.$$

Question: Let S dually represent the planet Saturn and let the R directly represent one of Saturn's rings. If this ring fell out of orbit, let the direct circle F on the surface of S approximate the debris field. What is F?

Question: Let S dually represent the planet Saturn and let the R directly represent one of Saturn's rings. If this ring fell out of orbit, let the direct circle F on the surface of S approximate the debris field. What is F?

Answer:

$$F = (S \wedge (R \wedge \infty)^*)^* = S \cdot (R \wedge \infty) = (S \cdot R)\infty - (S \cdot \infty)R.$$

Question: Let S dually represent the planet Saturn and let the R directly represent one of Saturn's rings. If this ring fell out of orbit, let the direct circle F on the surface of S approximate the debris field. What is F?

Answer:

$F = (S \wedge (R \wedge \infty)^*)^* = S \cdot (R \wedge \infty) = (S \cdot R)\infty - (S \cdot \infty)R$.

Question: Let $\{N_k\}_{k=0}^3$ be 4 dual planes forming the sides of a non-degenerate tetrahedron, and let S be a dual sphere containing all 4 vertices of the tetrahedron. If all planes are known, how do we find S? If S is known and all planes save one, how do we find the remaining plane?

Question: Let S dually represent the planet Saturn and let the R directly represent one of Saturn's rings. If this ring fell out of orbit, let the direct circle F on the surface of S approximate the debris field. What is F?

Answer:
$F = (S \wedge (R \wedge \infty)^*)^* = S \cdot (R \wedge \infty) = (S \cdot R)\infty - (S \cdot \infty)R.$

Answer: Not very pretty!

Recall the outermorphic property of versors!

Recall the outermorphic property of versors!

Then, if the m-blade B directly represents any geometry, (except a flat point), then there exists m points $\{x_k\}_{k=1}^m \subset \mathbb{V}^n$ such that

$$VBV^{-1} = V\left(\bigwedge_{k=1}^m p(x_k)\right)V^{-1} = \bigwedge_{k=1}^m Vp(x_k)V^{-1}.$$

Recall the outermorphic property of versors!

Then, if the m-blade B directly represents any geometry, (except a flat point), then there exists m points $\{x_k\}_{k=1}^m \subset \mathbb{V}^n$ such that

$$VBV^{-1} = V \left(\bigwedge_{k=1}^m p(x_k) \right) V^{-1} = \bigwedge_{k=1}^m Vp(x_k)V^{-1}.$$

Therefore, if we understand how V transforms $p(x)$ for any $x \in \mathbb{V}^n$, then we can predict how V transforms any geometry, (except flat points)!

Recall the outermorphic property of versors!

Then, if the m-blade B directly represents any geometry, (except a flat point), then there exists m points $\{x_k\}_{k=1}^m \subset \mathbb{V}^n$ such that

$$VBV^{-1} = V\left(\bigwedge_{k=1}^m p(x_k)\right)V^{-1} = \bigwedge_{k=1}^m Vp(x_k)V^{-1}.$$

Therefore, if we understand how V transforms $p(x)$ for any $x \in \mathbb{V}^n$, then we can predict how V transforms any geometry, (except flat points)!

A versor may or may not leave ∞ invariant under conjugation.

If the m-blade B dually represents any geometry, then we can write

$$VBV^{-1} = V(B^*)^*V^{-1} = (VB^*V^{-1})^*,$$

relating this to what we know about the transformation of *directly* represented geometries.

Types Of Transformations By Versors

All conformal transformations can be represented by versors!
Some of these include...

- Translations,
- Rotations,
- Dilations,
- Transversions.

Blades representative of geometry are also versors representative of transformations!

Blades representative of geometry are also versors representative of transformations!

- Planar reflections are represented by a dual planes!

Blades representative of geometry are also versors representative of transformations!

- Planar reflections are represented by a dual planes!
- Spherical reflections are represented by dual spheres!

Blades representative of geometry are also versors representative of transformations!

- Planar reflections are represented by a dual planes!
- Spherical reflections are represented by dual spheres!
- Translations & Rotations are two successive planar reflections in well chosen planes.

Blades representative of geometry are also versors representative of transformations!

- Planar reflections are represented by a dual planes!
- Spherical reflections are represented by dual spheres!
- Translations & Rotations are two successive planar reflections in well chosen planes.
- Dilations & Transversions are two successive spherical reflections in well chosen spheres.

Blades representative of geometry are also versors representative of transformations!

- Planar reflections are represented by a dual planes!
- Spherical reflections are represented by dual spheres!
- Translations & Rotations are two successive planar reflections in well chosen planes.
- Dilations & Transversions are two successive spherical reflections in well chosen spheres.

Corollary: We can use versors to transform transformations!

Blades representative of geometry are also versors representative of transformations!

- Planar reflections are represented by a dual planes!
- Spherical reflections are represented by dual spheres!
- Translations & Rotations are two successive planar reflections in well chosen planes.
- Dilations & Transversions are two successive spherical reflections in well chosen spheres.

Corollary: We can use versors to transform transformations!

Note: Points are null, (non-invertible), and therefore, planar and spherical reflections generate the versor group of all transformations.

Thank you for your time. Any questions?
